The Economic Impacts of the Federal Milk Marketing Order Consolidation and Reform Proposed Rule

USDA released the proposed rule for Federal Milk Marketing Order (FMMO) Consolidation and reform on January 23rd, 1998. The rule met the mandate of the 1996 farm bill to propose a plan to consolidate the number of federal orders. Class I differential and Basic Formula Price (BFP) reform was also addressed in the report. Based on the proposed rule and USDA's economic impact study, this briefing paper contains an analysis of the impacts of the consolidation and reform rule on U.S. representative dairy farms over the 1999-2004 period.

Four options are analyzed in this report. They include:

1A – A nationally coordinated system of location specific Class I price differentials.

The differential has a value of \$1.60 per cwt in the base zones of the Upper Midwest, Southwest, Midwest, and West. Differentials increase from the base areas to \$4.30 per cwt in Florida.

1B – A nationally coordinated system of relative value specific Class I differentials.

Like option 1A this proposal uses multiple basing points but a \$1.20 per cwt base differential rather than \$1.60 per cwt.

Because the 1B option results in substantial changes in Class I differentials, a phase in schedule of the differential changes is proposed. Three phase-in schedules are proposed for consideration in the proposed rule. Those schedules are:

- **1B phase-in.** The new differentials are phased in over 5 years (1999-2003) at 20 percent of the price difference annually between the current and 1B differential.
- **1B revenue neutral.** To offset the revenue lost during the phase-in, and aid producers during the transition, Class I differentials are increased \$0.55, \$0.35,

\$0.20, and \$0.10 per cwt annually, respectively for the 1999-2002 period, over the phased in Class I differential level.

- **1B revenue enhanced.** The transition differential is increased over the phase-in 1B level by \$1.10, \$.70, \$.40, and \$.20 per cwt annually, respectively over the 1999-2002 period. This would provide producers enhanced revenue to aid in the transition to the new differentials.

Method of Analysis

The Economic Research Service's (ERS) economic model of the dairy sector was used by USDA to analyze the economic impacts of the four proposed alternatives. The FAPRI November 1997 baseline was used as the baseline for analyses (Table 1). USDA's estimated milk price changes for each alternative as published in their economic impact analysis were applied to the FAPRI baseline. These projected price paths were used to analyze the impacts of each alternative on representative dairy farms across the U.S.

The dairy farms used in the analysis include 26 of the 80 representative crop and livestock farms developed in the major production areas across the United States (Figure 1). The location of these farms are primarily the result of discussions with staff of the House and Senate Agriculture Committees. Information necessary to simulate the economic activity of these representative farms are developed from panels of producers using a consensus building interview process. Normally two farms are developed in each region using separate panels of producers: one is representative of moderate size full-time farm operations while the second panel usually represents farms that are two to three times larger.

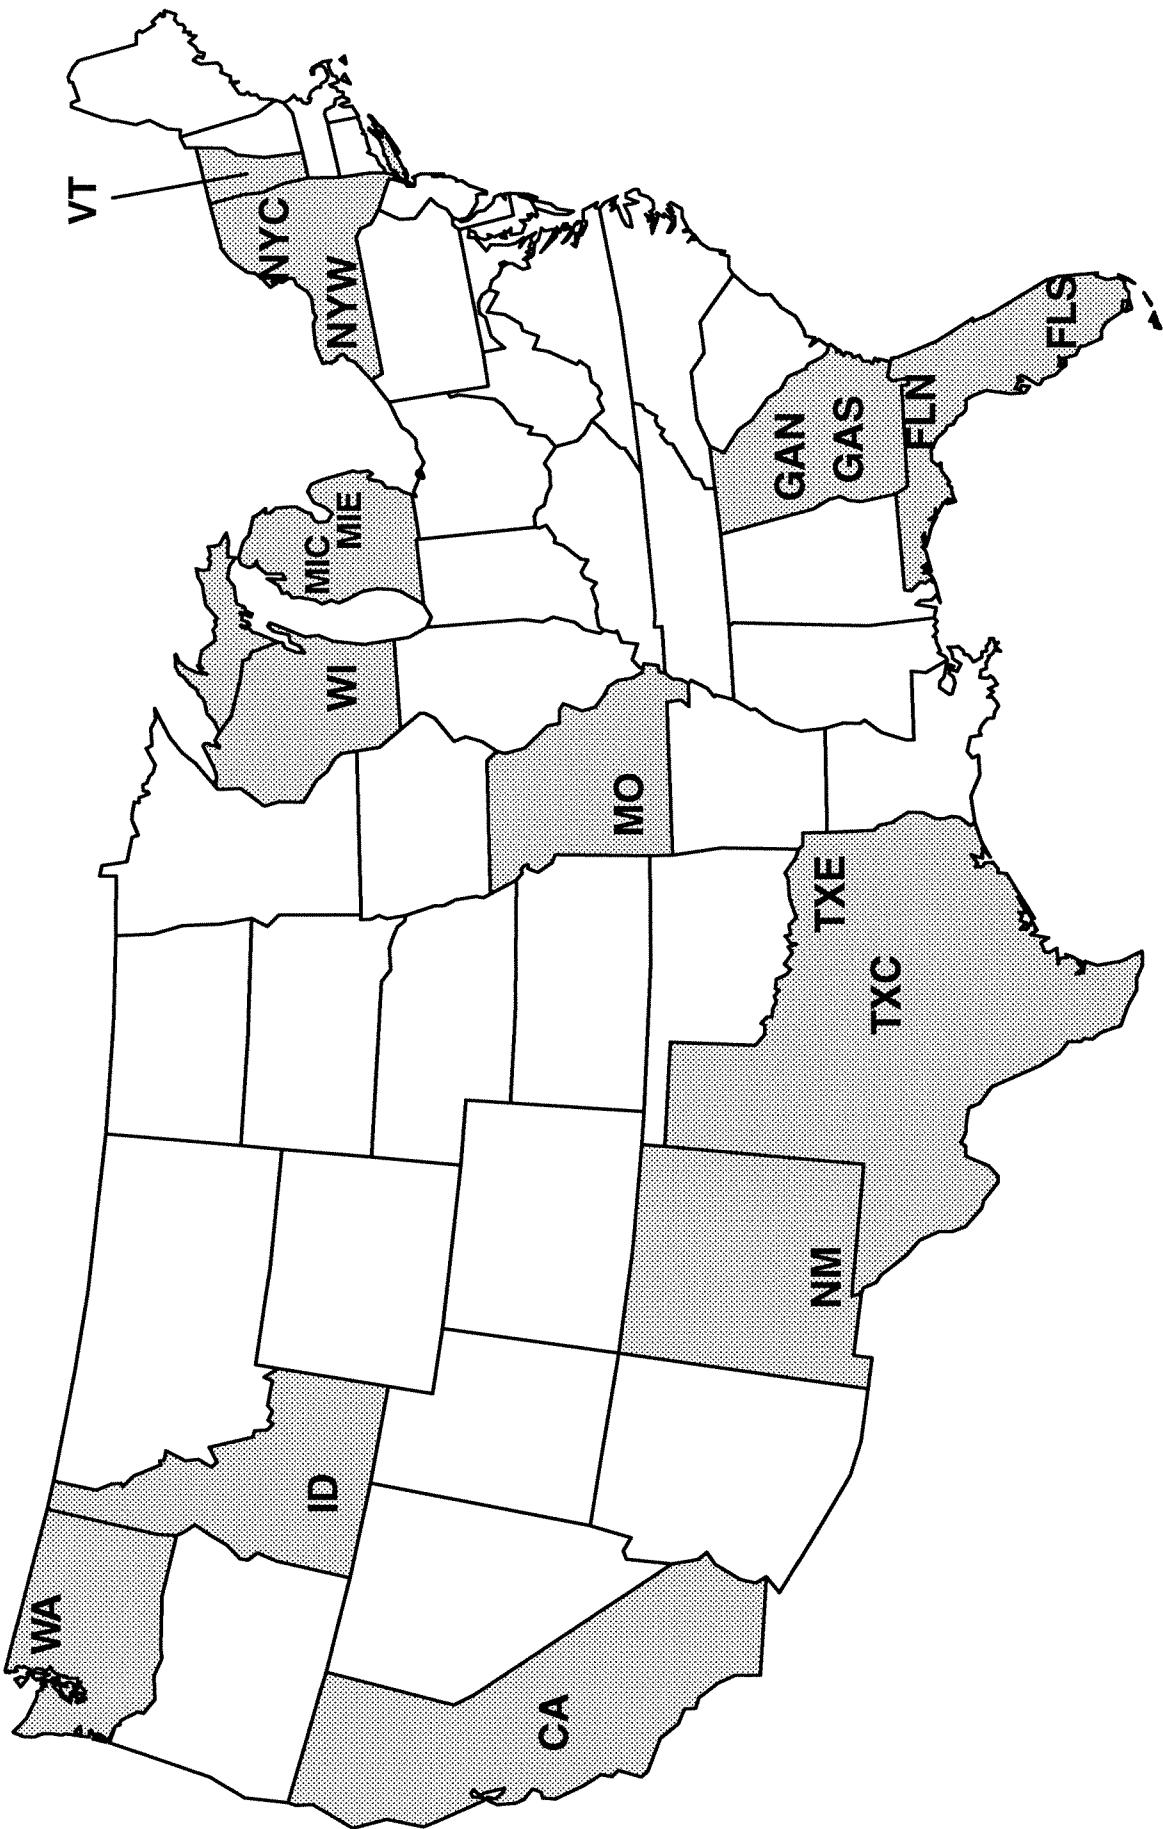

The data collected from the panel farms are analyzed in a whole farm simulation model (FLIPSIM) developed by AFPC. The producer panels are provided pro-forma financial

FIGURE 1. REPRESENTATIVE FARMS PRODUCING MILK

statements for their representative farm and are asked to verify the accuracy of the model's ability to reasonably reflect economic activity on their representative farm prior to using the farm for policy analysis.

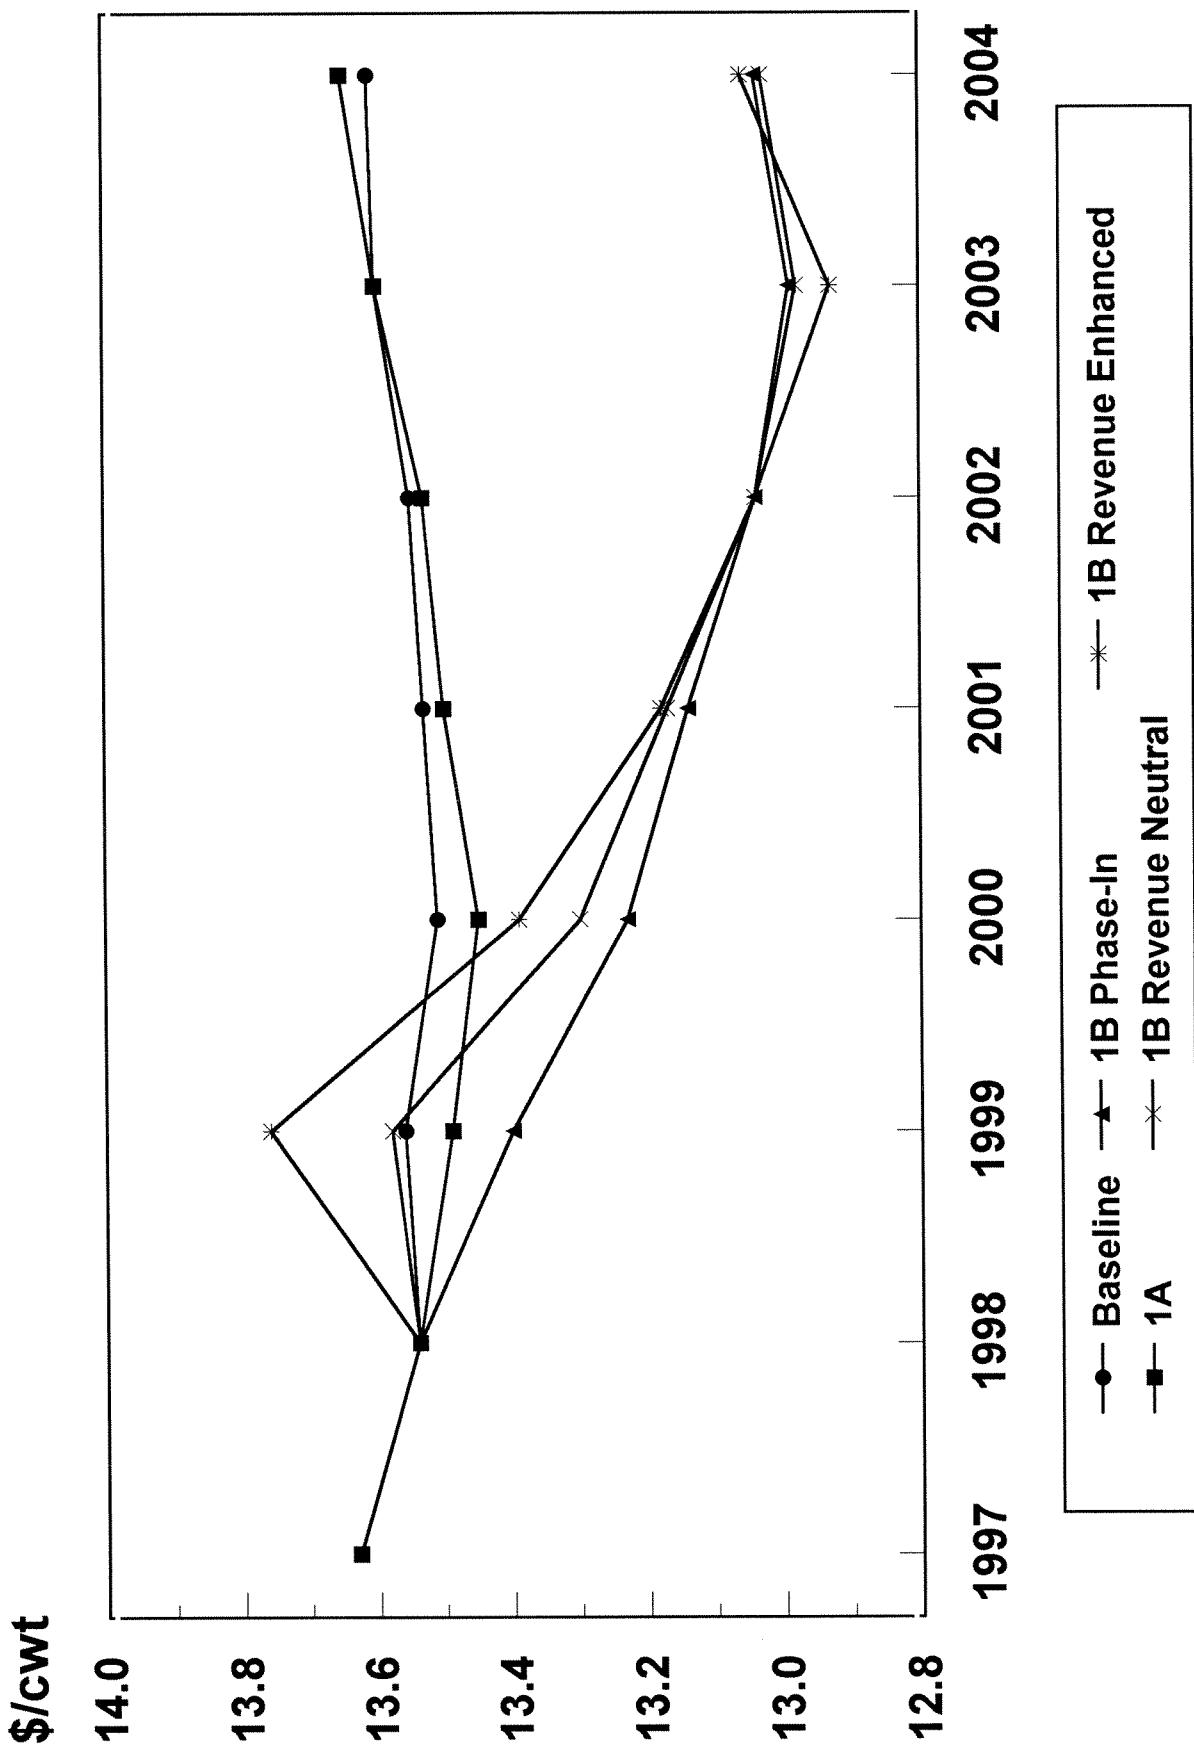

Results

- Sixteen of the 26 representative dairies indicate that option 1A generates the highest net cash farm income (NCFI) of any of the options. This is particularly the case at the end of the period where 1B prices decline materially. Option 1B with revenue enhancing transition differentials generates the highest average NCFI over the 1999-2004 period, on seven of the dairies. But, at the end of the transition period only three of these farms experience higher annual NCFI with the 1B option.
- The representative **Texas** dairies perform the best, financially, under option 1A. Reductions in NCFI from the baseline for option 1A, over the 1999-2004 period range from 1 to 3.3 percent (Appendix A). Of the transition alternatives for the proposed 1B option, reductions, in NCFI from the baseline range from 11 to 41 percent on the moderate East Texas and moderate Central Texas dairies, respectively. NCFI on the moderate Central Texas dairy declines to negative levels in 2004 for option 1B, regardless of the transition alternative. The baseline involving no change in Class I differentials from current levels generates higher NCFI than any of the alternatives.
- Given current milk movement patterns, the price impacts for the **New Mexico** dairy were weighted 2/3 to the Texas price and 1/3 to the New Mexico price. Of the four alternatives option 1A had the smallest average decline in NCFI from the base over the 1999-2004 period. The front end loading nature of the revenue enhanced 1B

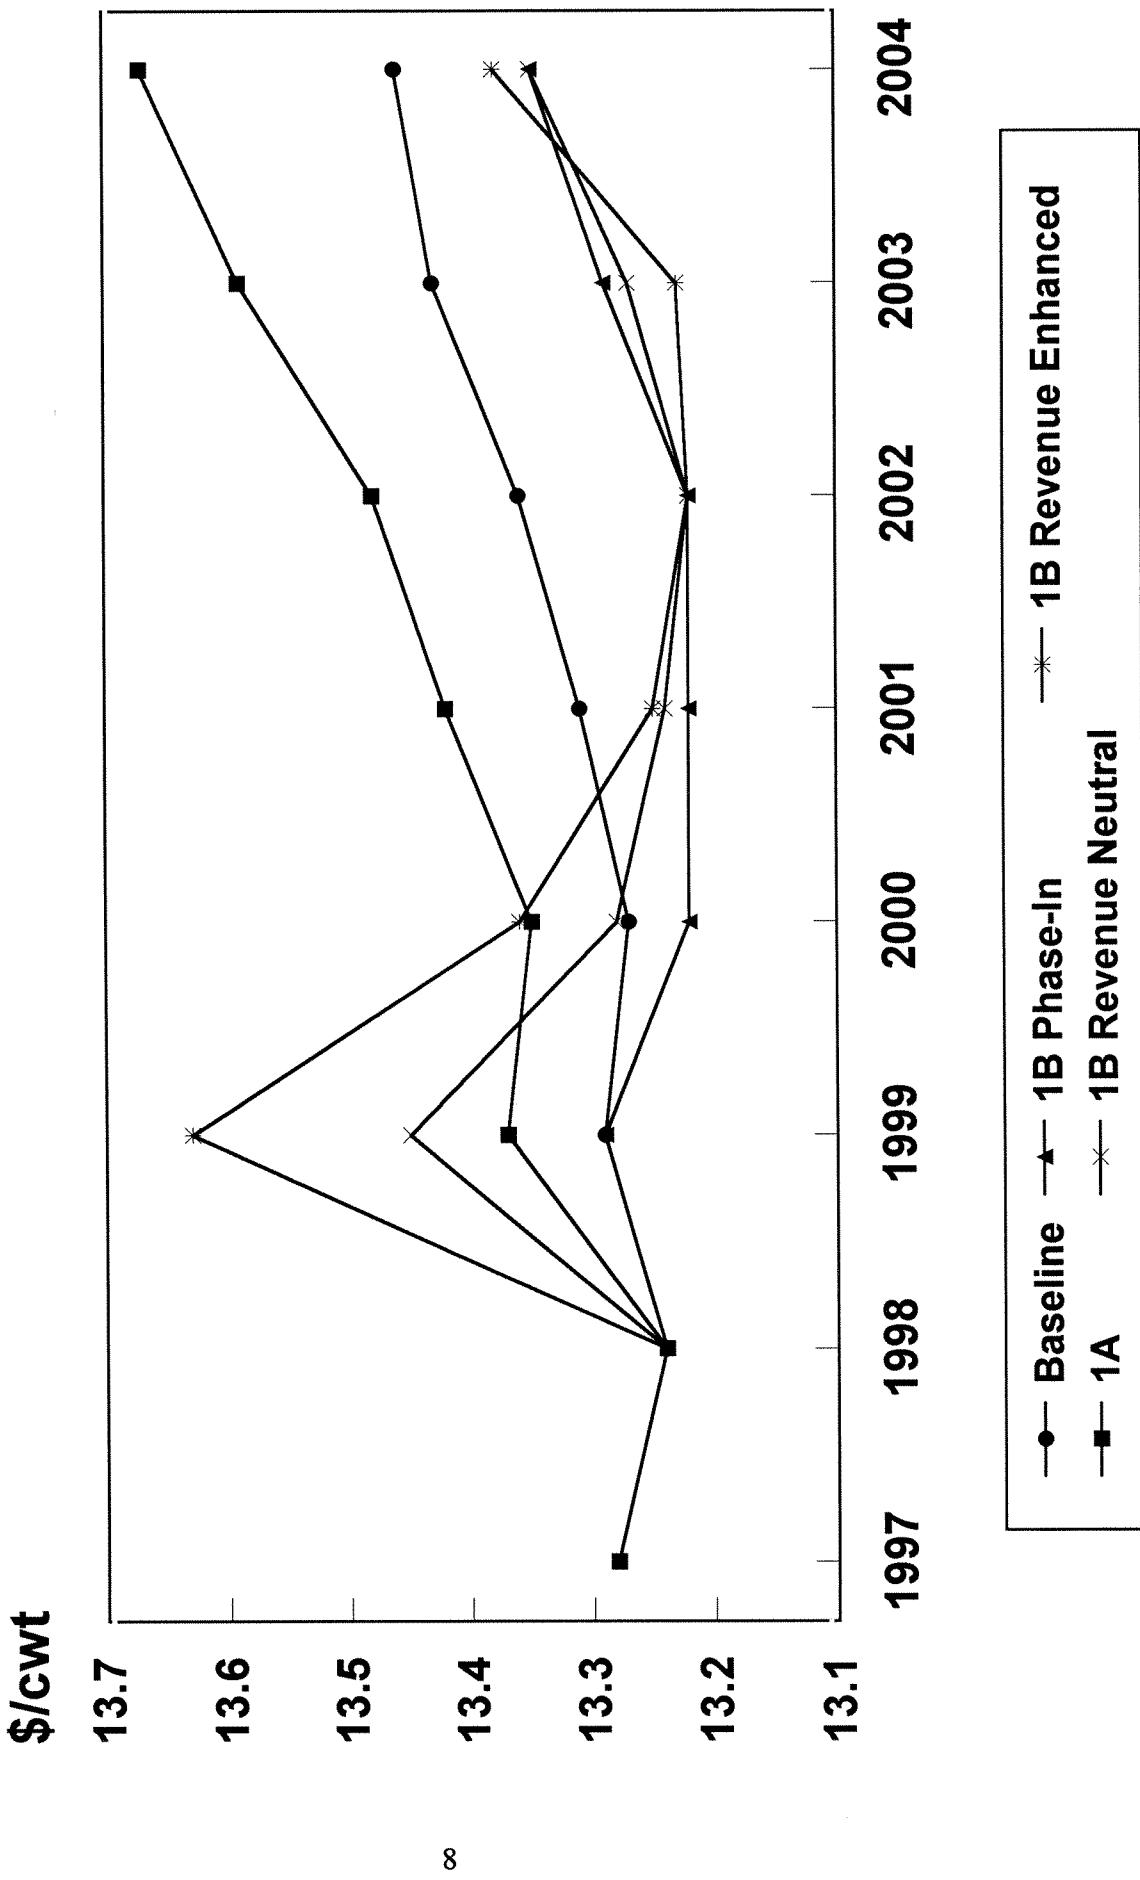

transition results in greater NCFI for this dairy in 1999-2000 than in option 1A. But, in 2001-2004 NCFI under option 1A exceeds that of 1B. Average NCFI declines 10 percent, from the baseline over the 1999-2004 period under the revenue enhanced 1B transition alternative. Like the Texas dairies, the baseline generates more NCFI than any of the alternatives.

- The revenue enhanced 1B option indicates decreases in average NCFI of less than 1 percent on the dairies in **New York** over the baseline. However, option 1A indicates increases in average NCFI in the 2 to 6 percent range.
- The revenue neutral phase-in averages slightly higher NCFI than the other two 1B options for the **Wisconsin** farms. The revenue enhanced transition alternative appears to result in a sufficient milk supply response to lead to less of an increase in prices and NCFI than the revenue neutral option. NCFI increases, over the baseline, range from about 3 to 5 percent on the moderate and large dairies, respectively, for each of the 1B alternatives.
- In several cases, Eastern Michigan, Central Michigan, North Georgia, and North Florida, the revenue enhanced option 1B results in the highest average NCFI over the 1999-2004 period. However, the added revenue generated by the transition differentials early in the phase-in period is enough to create the higher average. Closer examination indicates that over the 2002-2004 period annual NCFI is greater under option 1A. In these cases the average NCFI does not portray the entire picture of the impacts.
