Introduction

The Conservation Reserve Program (CRP) is one of the most successful Federal agricultural programs. While the program has been adjusted over time, for more than 30 years the primary emphasis has been to protect environmentally sensitive land while providing farmers with annual rental payments.

Texas has historically had the highest number of acres enrolled in the CRP. In any given year, 3 to 4 million of the slightly more than 30 million acres nationally have been enrolled in Texas.

Over time, as contracts have expired, most of the land that had been enrolled in the program was re-enrolled. However, due to funding limitations, the acreage cap has been reduced which will likely mean that many Texas farmers and landowners will not be able to re-enroll this land in the CRP. This publication, focusing on Texas AgriLife Extension District 8, is excerpted from a larger work and is part of a planned series of publications designed to provide farmers and landowners statewide with additional information regarding their options as their contracts begin to expire. This publication addresses where the CRP acreage is in Texas AgriLife Extension District 8 and when contracts will be expiring, as well as providing a historical view of how important the CRP program has been over the past 30 years. If you wish to see the larger report, it is available on the AFPC website at <http://www.afpc.tamu.edu/pubs/2/541/RR-10-01%20-%20for%20web.pdf>

Conservation Reserve Program Legislative History

The Conservation Reserve Program (CRP) was first established by the Food Security Act of 1985 with the purpose of removing up to 45 million acres from production and reducing damage to highly erodible soils and environmentally sensitive land. Patterned after the conservation reserve part of the Soil Bank Program that was initiated during the 1950s, the program offered annual rental payments and cost-share assistance up to 50% of expenses to producers for taking their land out of production and establishing long-term conserving covers. Landowners could enter into contracts for a minimum of 10 years or a maximum of 15 years. A county could not enroll more than 25% of its cropland unless the Secretary of Agriculture determined that doing so would not have an adverse economic impact. In its early years, CRP eligibility was limited to land with highly erodible soils, and, during the first nine signups, 34 million acres were enrolled.

The Food, Conservation, Agriculture, and Trade Act of 1990 (1990 Farm Bill) extended CRP land eligibility beyond highly erodible soils to include state water quality priority areas, plots of land that adopted high priority conservation practices, and "Conservation Priority Areas" (Chesapeake Bay, Long Island Sound, and the Great Lakes watershed). Producers were given the option to participate in limited fall and winter grazing or cropping between trees on CRP land in exchange for reduced rental rates. The 1990 Farm Bill also made changes to the way CRP contracts were ranked and annual rental rates were applied. The Environmental Benefits Index (EBI) was created as a way to rank offers based on water quality, air quality, and soil erodibility concerns. Maximum soil specific rental rates were also set allowing producers with highly productive and highly erodible soils to enter into contracts.

The Federal Agricultural Improvement Reform Act of 1996 capped CRP enrollment at 36.4 million acres. Wildlife habitat was also added to the EBI. CRP continuous sign-up was created to allow environmentally desirable land devoted to specific conservation practices to be enrolled in CRP at any time. Eligible conservation practices included riparian buffers, wildlife habitat buffers, wetland buffers, filter strips, wetland restoration, grass waterways, shelterbelts, living snow fences, contour grass strips, salt tolerant vegetation, and shallow water areas for wildlife. Continuous sign-up contracts were not subject to competitive bidding. The USDA allowed some producers an early out option to modify or end their CRP contracts after 5 years of the program. During 1997 – 2002, many of the early CRP contracts began to expire and approximately 22 million acres were enrolled. The

expiring contracts were not automatically renewed. There was increased competition because bids were ranked by the EBI.

The Farm Security and Rural Investment Act of 2002 made a few minor changes to CRP. It increased the acreage cap to 39.2 million acres. Cropping history requirements were changed to four of the last six years. CRP enrollment began to shift geographically. The Northern Great Plains region gained slightly at the expense of the Heartland and the Southern Seaboard. The Plains were able to offer land at a lower rental rate to increase the attractiveness of their offers.

The Food, Conservation, and Energy Act of 2008 capped CRP at 32 million acres beginning on October 1, 2009. Eligibility requirements were modified to land cropped in four of six years prior to 2008 rather than 2002. Alfalfa, legumes, and multi-year grasses in a rotation practice with an annual commodity could be used to meet the cropping history requirement. A local preference criterion was also added in determining the acceptability of CRP offers. In previous bills the Secretary used different criteria for different States and regions to determine acceptability. No more than 25% of a county's cropland could be enrolled in CRP; however, exceptions were created to waive this limit in the case of continuous or Conservation Reserve Enhancement Program (CREP) enrollment. A provision was also added for beginning or socially disadvantaged producers to help them make the transition from CRP land to production or other conservation programs; \$25 million in funding was authorized for these transitions.

About 75% of CRP contracts (28 million acres) are scheduled to expire between 2007 and 2010. During 2006, in an attempt to distribute the upcoming administrative burden, holders of expiring contracts were allowed to re-enroll or extend their contracts, and 82% of contract holders chose to do this. Over the next five years, 3.9 – 5.6 million acres are scheduled to expire annually.

A policy research report presents the final results of a research project undertaken by AFPC faculty. At least a portion of the contents of this report may have been published previously as an AFPC issue paper or working paper. Since issue and working papers are preliminary reports, the final results contained in a research paper may differ - but, hopefully, in only marginal terms. Research reports are viewed by faculty of AFPC and the Department of Agricultural Economics, Texas A&M University. AFPC welcomes comments and discussions of these results and their implications. Address such comments to the author(s) at:

Agricultural and Food Policy Center
Department of Agricultural Economics
Texas A&M University
College Station, Texas 77843-2124

or call (979) 845-5913.
